1. **All users have an account** to create itineraries, submit incident reports, subscribe to regions, or save places.

2. **Admins are authenticated staff users** and are the only entities allowed to post NewsPosts and create SafetyAlerts.

3. **Each Admin is assigned to exactly one Region**, and can only manage news and safety content for that Region.

4. **Each Place belongs to exactly one Region**. A Place cannot span multiple Regions in this model.

5. **Place specialization is disjoint**: a Place can only be one of the following:

    - Landmark

    - Eatery

    - TransitStation

6. **Place specialization is partial** : some Places may exist without being one of the three subclasses.

7. **Each NewsPost is published for exactly one Region**, and Regions can have multiple NewsPosts.

8. **SafetyAlert is a weak entity**:

    - It cannot exist without a parent NewsPost.

    - It has total participation in the identifying relationship.

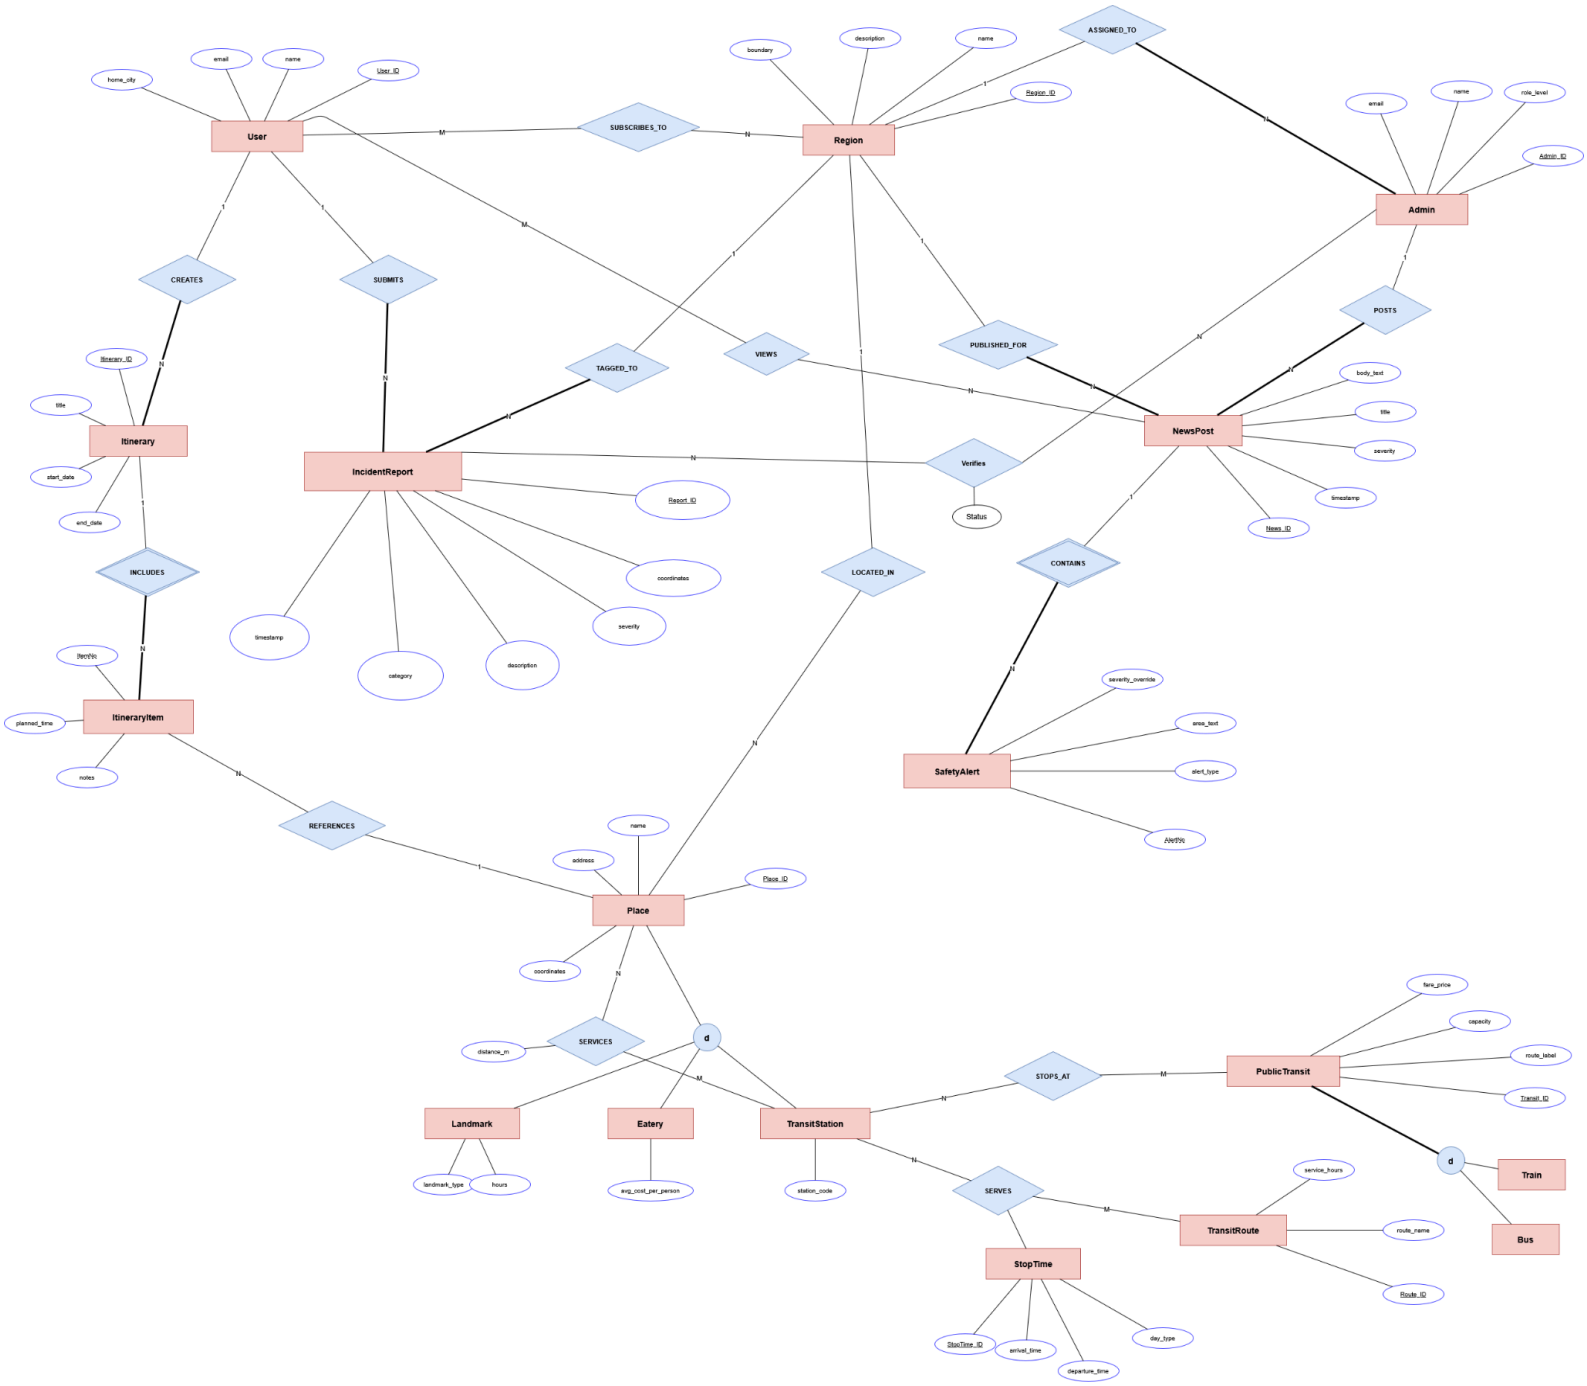
    - It is uniquely identified by (News_ID, AlertNo).

9. **Each IncidentReport is submitted by exactly one User**, and a User may submit multiple IncidentReports.

10. **Each IncidentReport is TAGGED_TO exactly one Region**, and a Region can have many IncidentReports.

11. **Users may subscribe to multiple Regions**, and each Region can have many subscribed Users.

12. **TransitRoute and TransitStation schedules are modeled using StopTime**, which stores arrival time, departure time, and sequence number.

13. **TransitStation–Place proximity is precomputed** and stored as a relationship attribute (e.g., walking distance or walking time).


Bolded lines are used for total participation
